

Physical CAD:

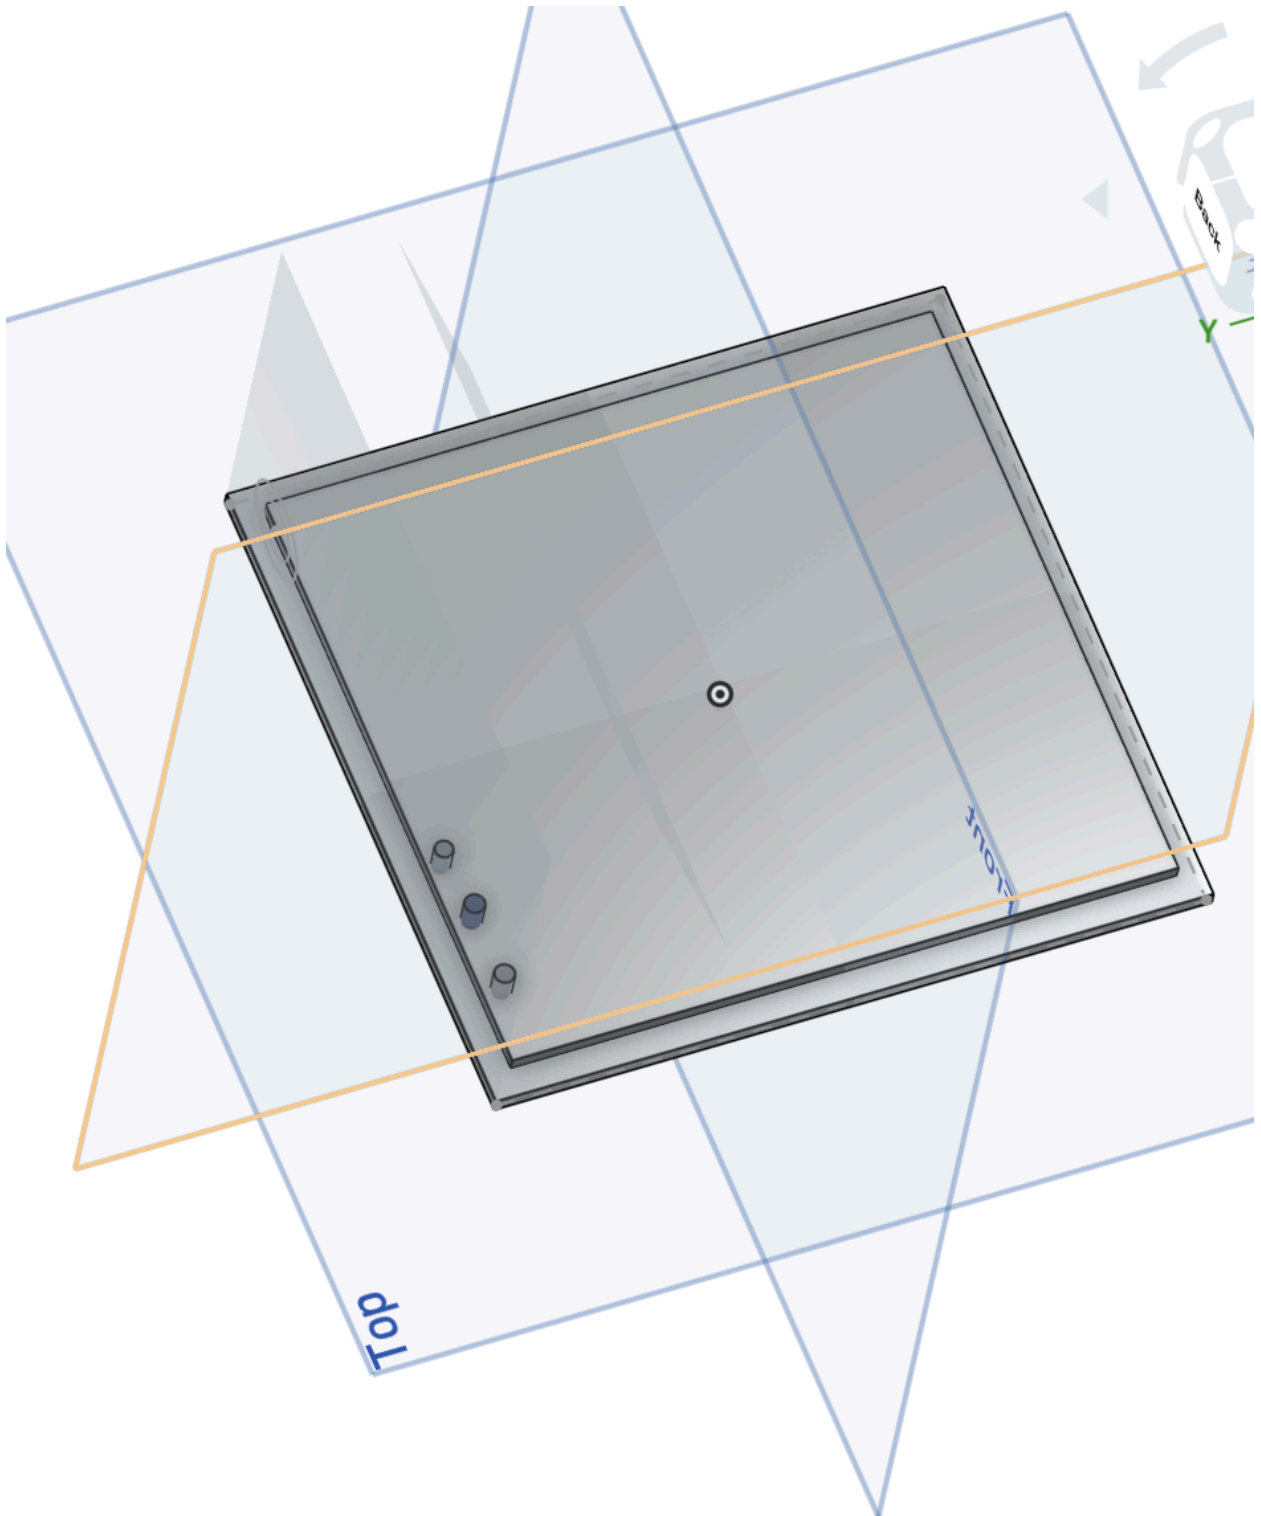

Ditoo Pro/Digital Clock design, with space for all 12 keycaps, allowing me to use intricate passwords, or even use Spotify APIs etc/pomodoro timers. Ledge for LCD to rest on, and will

add an extrude for wiring to go through and connect inside which is hollow.

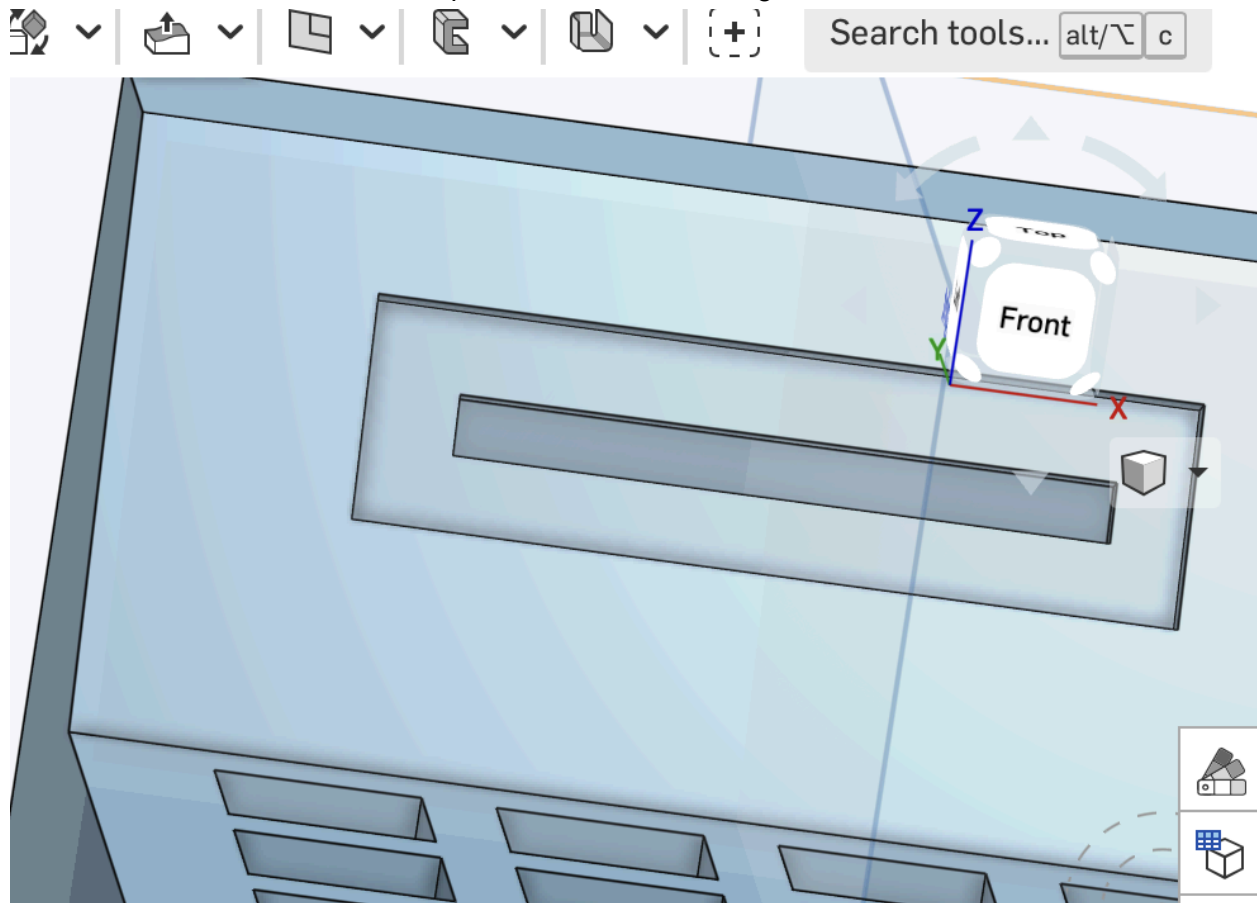

Rectangle for USB-C input, and a pocket for the buzzer. The lid on the bottom is detachable. I will have to find a way to secure it, either using a flap.

Added an extrude with a lift to vacuum seal the box essentially, with cylinders that will prop the

WEMOS C3 Mini near the USB-C port to avoid overheating.

Added a rectangle slot behind the ledge for the lcd screen so that there is place for wiring to pass through. Slot for keycaps are hollow and perfectly fit the keycaps: 14x14 inch, allowing for wiring to pass through.

Wiring:
